0. Introduction: The purpose of this note is to give a direct proof of some recent important results of E.B. Dynkin and A. Mandelbaum [2]. This also provides immediately the results in [3] with a very simple proof. This is achieved by avoiding the use of Poisson process. Let us set up some notation. Let (X, Σ, μ) be a probability space and (X^k, Σ^k, μ^k) be the k -fold product probability space. Let $h_k(x_1, \dots, x_k)$ be a symmetric function of k -variables. We call it canonical if $\int h_k(x_1, \dots, x_{k-1}, y) d\mu = 0$ for all $x_1, \dots, x_{k-1} \in X^{k-1}$. Let X_1, \dots, X_n be a i.i.d. X -valued random variable on a probability space with distribution μ . As in [2], define

$$\begin{aligned} \sigma_k^n(h_k) &= \sum_{1 \leq s_1 < \dots < s_k \leq n} h_k(X_{s_1}, \dots, X_{s_k}), \text{ for } k \leq n \\ &= 0 \text{ for } k > n. \end{aligned}$$

Let $H = \{(h_0, h_1, \dots) : h_k \text{ canonical and } \sum_{k=1}^{\infty} \frac{1}{k!} \|h_k\|_2^2 < \infty\}$ where h_0 is a constant and $\|\cdot\|_2$ is the norm in $L^2(X^k, \Sigma^k, \mu^k)$. On H define

$\|h\|^2 = \sum_{k=0}^{\infty} \|h_k\|_2^2 / k!$. H is the so-called exponential (Foch) space of $L_0^2(X, \Sigma, \mu)$ ($\phi \in L^2(X, \Sigma, \mu)$ with $E\phi(X) = 0$). It is a Hilbert space under coordinate addition, scalar multiplication and $\|\cdot\|$. For each $\phi \in L_0^2(X, \Sigma, \mu)$, $h^\phi \in H$ with $h_k^\phi = \phi(x_1), \dots, \phi(x_k)$. It can be easily seen that $\text{sp}\{h^\phi : \phi \in L_0^2(X, \Sigma, \mu)\}$ is dense in H . Define for each $h \in H$,

$$(0.1) \quad Y_n(h) = \sum_{k=0}^{\infty} n^{-k/2} \sigma_k^n(h_k).$$

Since $\sigma_k^n(h_k) = 0$ for $k > n$, this is a finite sum. Also, let

$$(0.2) \quad Y_n^t(h) = \sum_{k=0}^{\infty} n^{-k/2} \sigma_k^{[nt]}(h_k).$$

The main purpose is to show directly that $Y_n(h) \xrightarrow{\mathcal{D}} \sum_{k=0}^{\infty} \frac{I_k(h_k)}{k!}$ where $\xrightarrow{\mathcal{D}}$ denotes convergence in distribution and $I_k(h_k)$ denotes Ito-Wiener multiple

integral of h_k with respect to Gaussian random measure W with $EW(A)W(A') = \mu(A \cap A')$.

In the next section we discuss the convergence of $Y_n^t(h)$. We observe that for $\phi \in L_0^2(X, \Sigma, \mu)$

$$\begin{aligned} Y_n(h^\phi) &= \sum_{k=0}^n n^{-k/2} \sum_{1 \leq s_1 < \dots < s_k \leq n} \phi(X_{s_1}) \dots \phi(X_{s_k}) \\ &= \sum_{k=0}^n \sum_{1 \leq s_1 < \dots < s_k \leq n} \frac{\phi(X_{s_1})}{\sqrt{n}} \dots \frac{\phi(X_{s_k})}{\sqrt{n}} \\ &= \prod_1^n \left(1 + \frac{\phi(X_i)}{\sqrt{n}}\right). \end{aligned}$$

Let us observe that for any $\varepsilon > 0$,

$$\sum_j P(|\phi(X_j)| > \sqrt{\varepsilon j}) = \sum_j P(|\phi(X_1)|^2 > \varepsilon j) \leq \|\phi\|_2^2 < \infty.$$

Hence by Borel-Cantelli lemma, a.s. (for $j \leq n$)

$$|\phi(X_j)| \leq \sqrt{\varepsilon j} \leq \sqrt{\varepsilon} \sqrt{n} \quad \text{for } j \geq \text{some } N(\omega) \quad (N(\omega) < \infty).$$

But $\prod_1^n \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right) = \prod_1^{N(\omega)} \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right) \prod_{N(\omega)}^n \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right)$ giving for a.s. ω , so

$\lim_n Y_n(h^\phi) = \lim_n \prod_1^n \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right)$. Thus WLOG, we can assume for n large

$\left|\frac{\phi(X_j)}{\sqrt{n}}\right| < 1$ a.s. for all $j \leq n$ and $Y_n(h^\phi) = \prod_1^n \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right)$. Taking log on both sides and expanding $\log(1+x)$ we have

$$\log \prod_1^n \left(1 + \frac{\phi(X_j)}{\sqrt{n}}\right) = \sum_1^n \frac{\phi(X_j)}{\sqrt{n}} - \frac{1}{2} \sum_1^n \frac{\phi(X_j)^2}{n} + \varepsilon_n(\phi)$$

where $\varepsilon_n(\phi) \xrightarrow{P} 0$ by the WLLN and since $\max \left|\frac{\phi(X_j)}{\sqrt{n}}\right| \xrightarrow{P} 0$ by Chebychev's Inequality,

i.e. the $(Y_n(h^\phi)) \xrightarrow{D} \exp[I_1(\phi) - \frac{1}{2}\|\phi\|_2^2]$. Using Cramér-Wold device and the above argument we get

0.3 Lemma: For any finite subset $\{\phi_1, \dots, \phi_k\} \subseteq L^2(X, \Sigma, \nu)$

$$(Y_n(h^{\phi_1}), \dots, Y_n(h^{\phi_k})) \xrightarrow{D} (\exp(I_1(\phi_1) - \frac{1}{2}\|\phi_1\|_2^2), \dots, \exp(I_1(\phi_k) - \frac{1}{2}\|\phi_k\|_2^2)).$$

As a consequence, we get for $\{\phi_i, i \in I\}$ a finite subset of $L^2(X, \Sigma, \nu)$ and $\{c_i, i \in I\} \subseteq \mathbb{R}$,

$$(0.3)' \quad Y_n\left(\sum_{i \in I} c_i h^{\phi_i}\right) \xrightarrow{D} \sum_{k=0}^{\infty} \frac{I_k\left(\left[\sum_{i \in I} c_i h^{\phi_i}\right]_k\right)}{k!}.$$

We now observe that for $h, h' \in H$,

$$(0.4) \quad E[Y_n(h) - Y_n(h')]^2 = \sum_k \binom{n}{k} n^{-k} \|h_k - h'_k\|^2 \leq E\|h - h'\|^2,$$

since $E\sigma_k^n(h_k - h'_k) \sigma_\ell^n(h_\ell - h'_\ell) = \binom{n}{k} \|h_k - h'_k\|^2 \delta_{k\ell}$ by ([2], p. 744). Also,

$$(0.5) \quad E\left(\sum_{k=0}^{\infty} I_k(h_k)/k! - \sum_{k=0}^{\infty} \frac{I_k(h'_k)}{k!}\right)^2 = \|h - h'\|^2.$$

Thus we get

(0.6) Theorem: For any $h \in H$,

$$Y_n(h) \xrightarrow{D} W(h) = \sum_{k=0}^{\infty} \frac{I_k(h_k)}{k!}$$

Proof: Let $h \in H$ and $\epsilon > 0$. Choose $h' = \sum_{i \in I} c_i h^{\phi_i}$ such that $\|h - h'\|^2 < \epsilon/2$.

Now consider for $t \in \mathbb{R}$

$$\begin{aligned} |E(e^{itY_n(h)} - e^{itW(h)})| &\leq E|e^{itY_n(h)} - e^{itY_n(h')}| + E|e^{itY_n(h')} - e^{itW(h')}| \\ &\quad + E|e^{itW(h')} - e^{itW(h)}|. \end{aligned}$$

Using Schwartz's Inequality and the fact $|e^{ix} - 1| \leq |x|$ we get that the first

and third term of the above inequality are dominated by $t^2 E \|h - h'\|^2$ using (0.4) and (0.5). Hence by (0.3)'

$$\lim_{n \rightarrow \infty} |E e^{itY_n(h)} - E e^{itW(h)}| \leq \epsilon/2.$$

As ϵ is arbitrary we get the result.

Finally, we make some observations to be used later.

$$(0.7) \quad Y_n^t(h^\phi) = \sum_{k=0}^{[nt]} n^{-k/2} \sum_{1 \leq s_1 < \dots < s_k \leq [nt]} \phi(X_{s_1}) \dots \phi(X_{s_k}) = \prod_1^{[nt]} \left(1 + \frac{\phi(X_i)}{\sqrt{n}}\right).$$

Also, $\min(t,s)\mu(A \cap A')$ is a covariance on $[0, \infty) \times \Sigma$ giving that there exists a centered Gaussian process $\underline{W}(t, A)$ with $E \underline{W}(t, A) \underline{W}(s, A') = \min(t,s)\mu(A \cap A')$. Let for $T < \infty$

$$H_T = \{(h_0, h_1, \dots) \in H : \sum_{k=0}^T T^k \frac{\|h_k\|^2}{k!} < \infty\}.$$

1. Invariance Principle: Let $D[0, T]$, ($T \leq \infty$) be the space of right continuous functions on $[0, T]$ ($[0, \infty)$) with left limits at each $t \leq T$. The space $D[0, T]$ is endowed with Skorohod topology [1]. The topology in $D[0, \infty)$ is the one described in Whitt [4]. We note that

$X_{[nt]} = \sum_1^{[nt]} \left(\frac{\phi^2(X_i) - E\phi^2}{n}\right)$ has stationary independent increments. So for $\epsilon > 0$

$$P\left(\sup_{0 \leq t \leq T} |X_{[nt]}| > \epsilon\right) \leq C \cdot P(|X_{[nT]}| \geq \epsilon) \rightarrow 0$$

by the weak law of large numbers. Using this, the arguments preceding Lemma 0.3, invariance principle and Cramér-Wold device we get the following analogue of Lemma 0.3.

Lemma 1.1: $(Y_n^t(h^{\phi_1}), \dots, Y_n^t(h^{\phi_k})) \xrightarrow{\mathcal{D}_{k,T}} (\exp(t_1^t(\phi_j) - \frac{1}{2}t\|\phi_j\|^2), j=1, \dots, k)$

where $I^t(\phi_j) = \iint 1_{(0,t]}(u)\phi_j(x)W_k(du,dx)$. Here $\xrightarrow{D_{k,T}}$ denotes convergence in $D^k[0,T]$ with respect to product topology.

We note that $W(t,A)$ is a Brownian motion for each $A \in \Sigma$. Thus we can choose $I^t(\phi)$ continuous for each ϕ and a martingale in t as $I^t(\phi) = \int \phi(x)W(t,dx)$. We get for $\{c_1, \dots, c_k\} \subseteq \mathbb{R}$, (k finite),

$$Y^t\left(\sum_{j=1}^k c_j h^{\phi_j}\right) \rightarrow \sum_{j=1}^k c_j \exp\left(I^t(\phi_j) - \frac{1}{2}t \|\phi_j\|^2\right).$$

Let $\phi \in L_0^2(X, \Sigma, \mu)$, $\|\phi\| = 1$, and denote

$$(\phi^k)^t = \phi(x_1) \dots \phi(x_k) 1_{(0,t]}(u_1) \dots 1_{(0,t]}(u_k).$$

Define $I_k(\phi^k)^t = k! H_k(t, I(\phi))$ where H_k is Hermite polynomial, i.e.

$\sum_{k=0}^{\infty} \gamma^k H_k(t, x) = \exp(\gamma x - \frac{1}{2}\gamma^2 t)$. For $\phi \in L_0^2(X, \Sigma, \mu)$, $\|\phi\| = 1$, we define for

$$(h^\phi)^t = (1, \phi^t, (\phi^2)^t, \dots),$$

$$W(h^\phi)^t = \sum_{k=0}^{\infty} \frac{I_k(\phi^k)^t}{k!},$$

and extend it linearly to $(\sum c_j h^{\phi_j})^t$. It is a martingale. Let $h \in H_T$ $\{h(n)\}$ a sequence in $\text{sp}\{(h^\phi)^t, \phi \text{ in CONS in } L_0^2(X, \Sigma, \mu)\} \subseteq H_T$, then

$$\begin{aligned} P(\sup_{t \leq T} |W^t(h(n)) - h(m)| \geq \varepsilon) &\leq E |W^T(h(m)) - h(n)|^2 \\ &= \sum_{k=0}^{\infty} T^k \frac{\|h_k(m) - h_k(n)\|^2}{k!} \end{aligned}$$

using Doob's inequality and argument as in (0.5). Define for $h \in H^t$,

$W^t(h) = -\lim W^t(h_n)$ where the limit is uniform on compact for $h_n \rightarrow h$. Then

$W^t(h)$ is right continuous martingale and has the same distribution as

$\sum_k I_k^t(h_k)/k!$. Now we derive the main theorem of [3].

Theorem 1.2: $Y_n^t(h) \xrightarrow{D} W^t(h)$ in $D[0,T]$ for $h \in H^T$ for each $T < \infty$.

Proof: Let $h \in H$ and $\varepsilon > 0$, choose $h'_k \in \text{sp}\{h^{\zeta} : \zeta \in L_0^2(X, \Sigma, \nu)\} \ni h_k \rightarrow h$. Now define

$$X_{nk}^{\cdot} = Y_n^{\cdot}(h'_k), Z_n^{\cdot} = Y_n^{\cdot}(h), X_k^{\cdot} = W^{\cdot}(h'_k) \text{ and } X = W^{\cdot}(h).$$

Then $X_{n,k}^{\cdot} \xrightarrow{\mathcal{D}} X_k^{\cdot}$ as $n \rightarrow \infty$ in $D[0, T]$ for each $T < \infty$ by Lemma 1.1. Also $X_k^{\cdot} \xrightarrow{\mathcal{D}} X$ as $n \rightarrow \infty$ in $D[0, T]$ for each $T < \infty$. In addition,

$$P\left(\sup_{0 \leq t \leq T} |X_{nk}^{\cdot} - Z_n^{\cdot}| \geq \varepsilon\right) \leq E|Y_n^T(h - h'_k)|^2 \leq T \|h - h'_k\|^2$$

giving $\lim_{k \rightarrow \infty} \overline{\lim}_n P(\rho(X_{nk}^{\cdot}, Z_n^{\cdot}) \geq \varepsilon) \rightarrow 0$ with ρ being the Skorohod metric on $D[0, T]$. This implies by ([1], Thm 4.2, p. 25) that $Z_n^{\cdot} \xrightarrow{\mathcal{D}} W^{\cdot}(h)$ in $D[0, T]$ ($T < \infty$) giving the result.

Remark: In the above arguments we may use an interpolated version of $Y_n^t(h)$ from the beginning and use appropriate version of Donsker's Invariance Principle to conclude above convergence occurs in $D[0, T]$ in sup norm giving $W^t(h)$ continuous.
